Small Business Desktop/Laptop Security

Desktop security involves protecting each desktop and laptop in your organization. The term “You are only as strong as your weakest link” is very true. A single desktop compromised by a virus can spread very easily to other computers or to your servers. Viruses take many shapes and normally are used to profit the author by using your computer as a node to send SPAM email or catalog your keyboard strokes and send them back to the author.

Another type of security risk is called Spyware or Malware. This type of attack primarily is used to harvest information about your computer or install software and continuously prompt you to purchase the software to remove it. This risk is mainly a productivity nuisance.

In the computer security industry we utilize several pieces of software typically bundled together to provide protection against both viruses and malware. Anti-Virus / Anti-Spyware is the general name we give this software.

More advanced and secure customers require even more security. To accomplish this level of security, we are able to encrypt the entire hard drive of the laptop or desktop. This encryption is military grade and has yet to be broken. This protection safely keeps your data safe even if you lose your laptop or have a break-in.

Now if you already suspect that you may have a virus or your computer is running slow or continually have pop-ups, we can clean up these issues. Typical cleanup and restore of a system takes 1-2 hours.
